

Laboratory: Center for Nanoscience and Nanotechnology (C2N)

 Group of Solid State Quantum Optics - <http://quantumdot.eu/>
Address: 10 Bd Thomas Gobert, 91120 Palaiseau (south of Paris area)

Thesis director: Loïc Lanco / +33 (0) 1 70 27 03 73 / loic.lanco@univ-paris-diderot.fr
Co-advisor: Pascale Senellart / +33 (0) 1 70 27 05 67 / pascale.senellart-mardon@c2n.upsaclay.fr
PhD offer: a spin-photon interface for quantum entanglement and quantum logic operations
Summary

This PhD project is funded by the Innovative Training Network ITN QUDOT-TECH (www.gudot-tech.eu) that aims to construct a solid-state platform for on-chip quantum information processing. In this framework, our group aims at **controlling the interaction between light and matter at the most fundamental quantum level**: qubits. We recently developed an **efficient interface between a single material qubit** (the spin of a single charge) and a **single photonic qubit** (the polarization of a single photon). Our interface uses the spin qubit carried by a semiconductor hole, confined in a nanometer-scale InAs quantum dot (QD). This quantum dot is deterministically coupled to an electrically-contacted pillar microcavity : such technology invented in C2N has already allowed developing high-efficiency sources of quantum light¹, and demonstrating the first optical nonlinearity reaching the single-photon level².

As we recently demonstrated, a photon reflected by such a QD-cavity structure can experience a drastically-enhanced rotation of its polarization, which allows **mapping the spin quantum state onto a photonic polarization state**³. Since then, we have implemented a technique allowing the complete tomography of a polarization qubit in the Poincaré sphere⁴, and we recently demonstrated **the optical probing of a single spin using single photons**. In such experiment every single detected photon leads to a measurement back-action on the spin qubit.

In this thesis, we will explore the numerous perspectives of such a spin-photon interface for quantum information. A major objective will be to demonstrate **new forms of spin-photon entanglement and photon-photon entanglement**, and develop **quantum gates mediated by the spin-photon interaction**. We will also perform **fundamental quantum measurements** and study the dynamics of a single spin in a solid-state matrix.

Funding conditions : the PhD salary is ~2200€ net per month (+ family allowance if applicable). During its PhD the successful candidate will also benefit from an **additional funding for several visiting trips (typically 1-2 months each) in the partner teams (incl. Cambridge, Basel, Grenoble, Copenhagen)**.

Requested profile: **we welcome highly-motivated applicants with excellent background in quantum physics, optics, and/or solid state physics**. Candidates must not have resided or carried out their activities - work, studies, etc.- in France for more than 12 months in the 3 years immediately before starting the PhD.

Applications (CV, transcript of studies, statement of motivation) should be sent by email to Loïc Lanco (loic.lanco@univ-paris-diderot.fr) and Pascale Senellart (pascale.senellart-mardon@c2n.upsaclay.fr)
